PROBLEM DESCRIPTION

Currently Rental bikes are introduced in many urban cities for the enhancement of mobility comfort. It is important to make the rental bike available and accessible to the public at the right time as it lessens the waiting time. Eventually, providing the city with a stable supply of rental bikes becomes a major concern. The crucial part is the prediction of bike count required at each hour for the stable supply of rental bikes.

BUSINESS UNDERSTANDING

- Bike rentals have become a popular service in recent years and it seems people are using it more often. With relatively cheaper rates and ease of pick up and drop at own convenience is what making this business thrive.
- Mostly used by people having no personal vehicles and also to avoid congested public transport that's why they prefer rental bike.
- Therefore the business to strive and profit more, it has to be always ready and supply no. of bikes at different locations, to fulfill the demand.
- Our project goal is a pre planned set of bike count values that can be a handy solution to meet all demands.

DATA SUMMARY

[4]:

| | Date | Rented Bike Count | Hour | Temperature(°C) | Humidity(%) | Wind speed (m/s) | Visibility (10m) | Dew point temperature(°C) | Solar Radiation (MJ/m2) | Rainfall(mm) | Snowfall (cm) | Seasons | Holiday | Functioning Day |
|---|------------|-------------------|------|-----------------|-------------|------------------|------------------|---------------------------|-------------------------|--------------|---------------|---------|------------|-----------------|
| 0 | 01/12/2017 | 254 | 0 | -5.2 | 37 | 2.2 | 2000 | -17.6 | 0.0 | 0.0 | 0.0 | Winter | No Holiday | Yes |
| 1 | 01/12/2017 | 204 | 1 | -5.5 | 38 | 0.8 | 2000 | -17.6 | 0.0 | 0.0 | 0.0 | Winter | No Holiday | Yes |
| 2 | 01/12/2017 | 173 | 2 | -6.0 | 39 | 1.0 | 2000 | -17.7 | 0.0 | 0.0 | 0.0 | Winter | No Holiday | Yes |
| 3 | 01/12/2017 | 107 | 3 | -6.2 | 40 | 0.9 | 2000 | -17.6 | 0.0 | 0.0 | 0.0 | Winter | No Holiday | Yes |
| 4 | 01/12/2017 | 78 | 4 | -6.0 | 36 | 2.3 | 2000 | -18.6 | 0.0 | 0.0 | 0.0 | Winter | No Holiday | Yes |

- This dataset contain 8760 rows and 14 columns
- Three categorical feature 'Seasons', 'Holiday' & 'Functioning Day'
- One datetime column 'Date'
- We have some numerical type variable such as temperature, humidity, wind, visibility, dew point temp, solar radiation, rainfall, snowfall which shows the environmental conditions for that particular hour of the day.

DATA SUMMARY

- There are no missing values present.
- There are no Duplicate values present.
- There are no null values.
- The dependent variable is 'rented bike count' which we need to make predictions on.
- The dataset shows hourly rental data for one year(1 December 2017 to 31 November 2018)(365 days).
- We changed the feature 'Date' to Day, Month and Year.

FEATURE TYPES

FEATURES

NUMERICAL

- Hour
- Temp
- Humidity
- Wind
- Rainfall
- Snow
- Visibility
- Solar Radiation
- Day
- Month
- Year

CATEGORICAL

- Seasons
- Holiday
- Functioning day

TARGET VARIABLE

Rented Bike Count

FEATURE SUMMARY

- Date : year-month-day
- Rented Bike count - Count of bikes rented at each hour
- Hour - Hour of the day
- Temperature-Temperature in Celsius
- Humidity - %
- Windspeed - m/s
- Visibility - 10m
- Dew point temperature - Celsius
- Solar radiation - MJ/m²
- Rainfall - mm
- Snowfall - cm
- Seasons - Winter, Spring, Summer, Autumn
- Holiday - Holiday/No holiday
- Functional Day - NoFunc(Non Functional Hours), Fun(Functional hours)

UNIQUE FEATURE OF DATASET

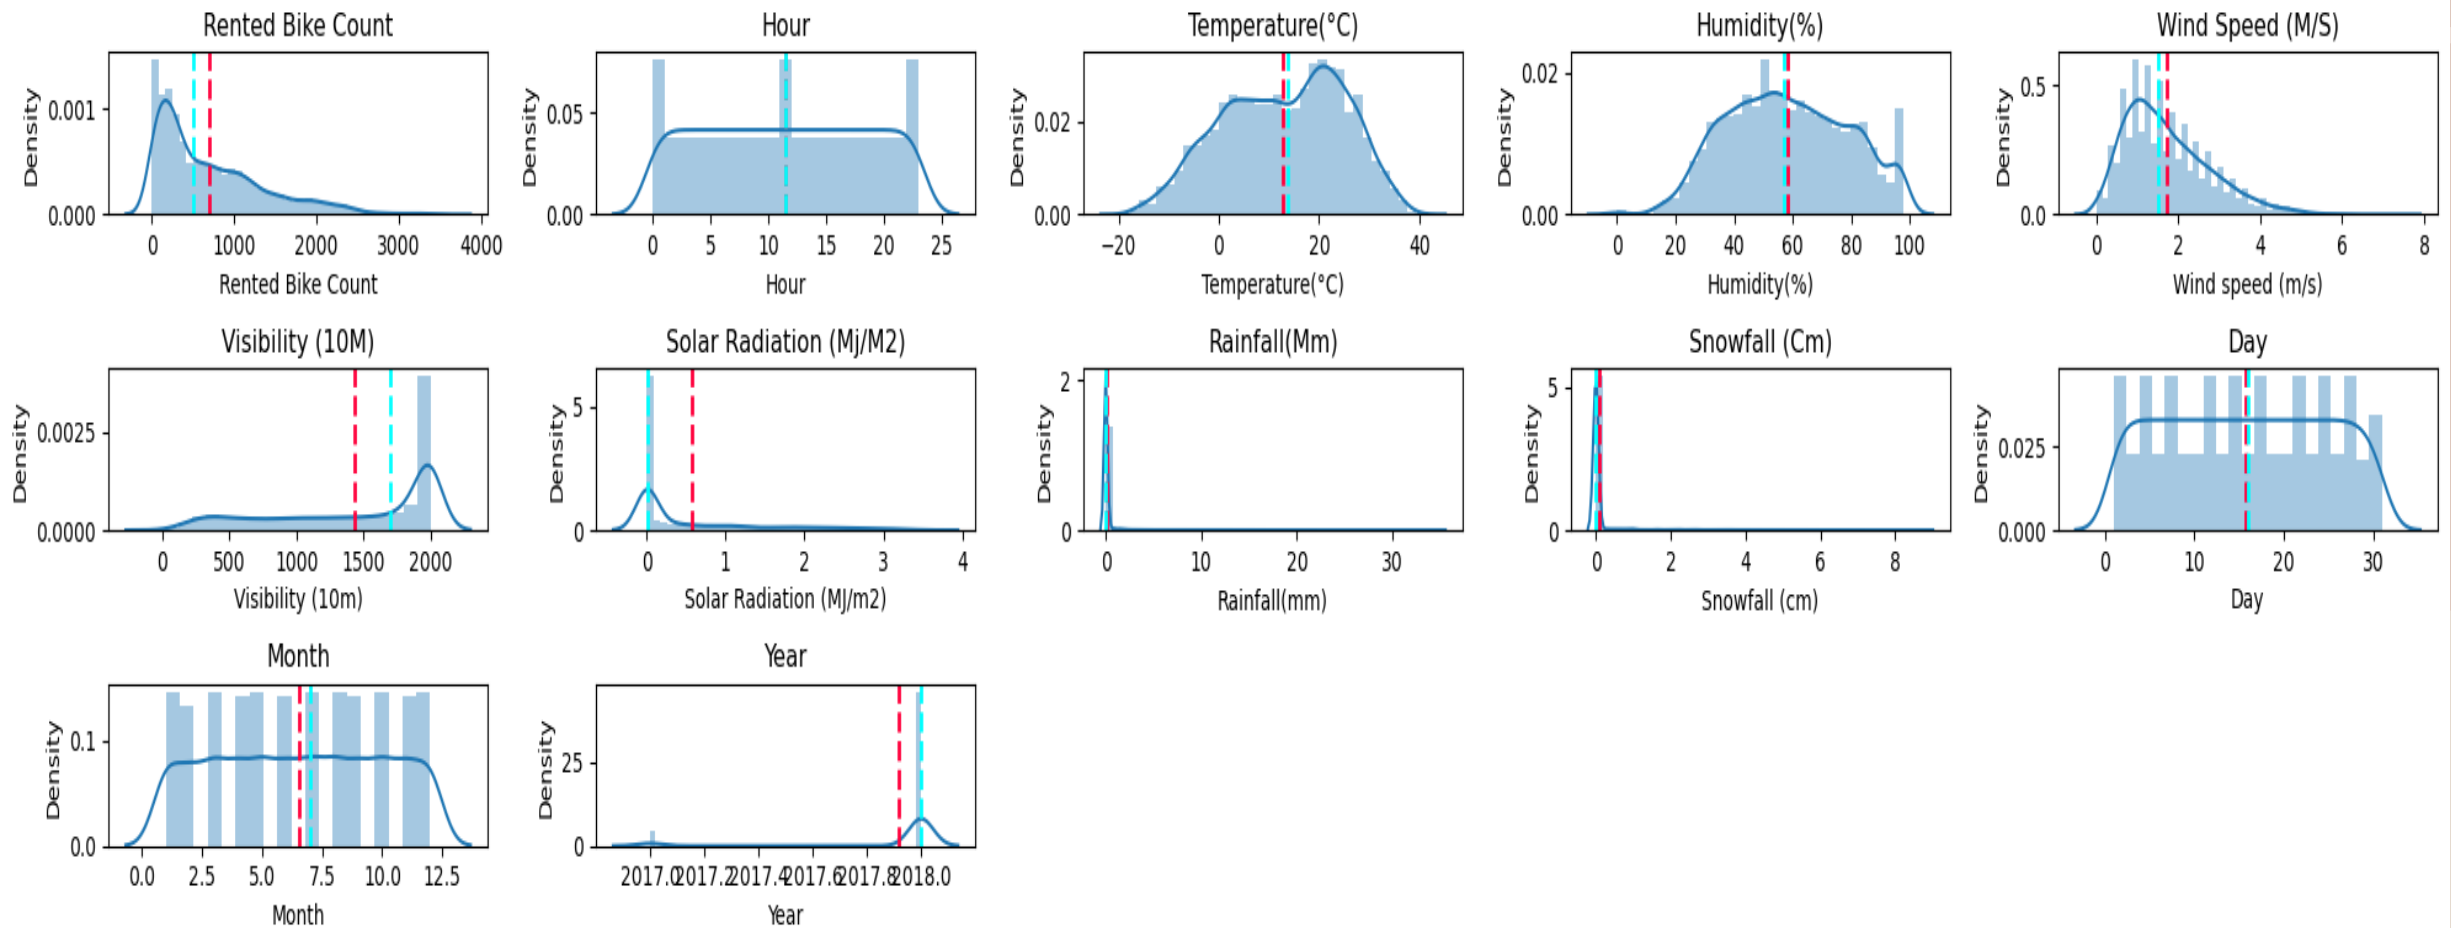

Month wise analysis

Season by analysis

VISUALIZING DISTRIBUTION

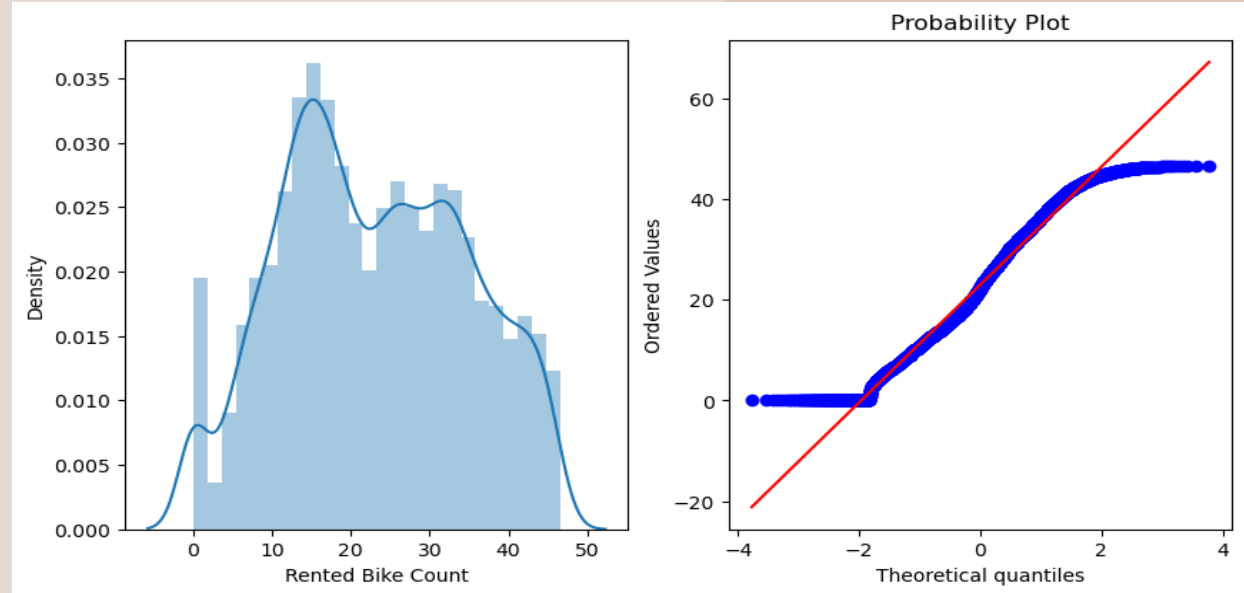

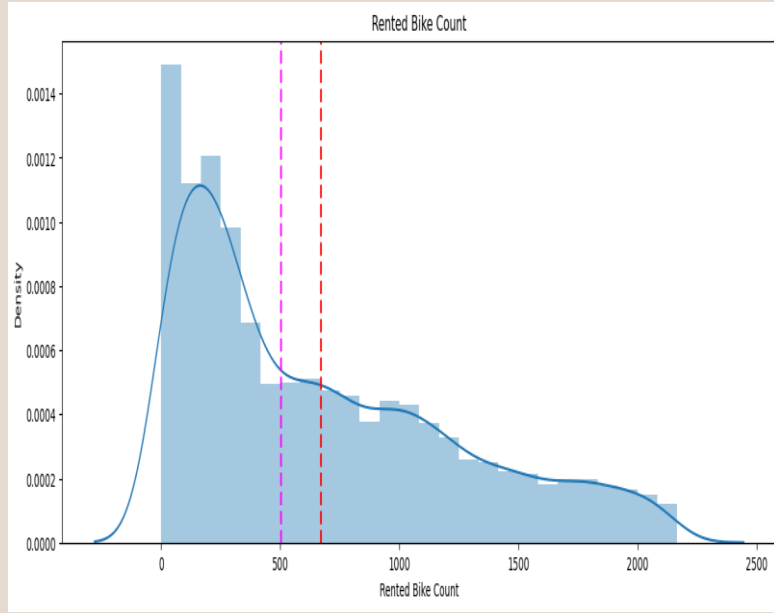

CHECKING OUTLIERS

- We see outliers in some columns like Solar radiation, Wind, Rainfall, and Snowfall but lets not treat them because they may not be outliers as snowfall, rainfall etc. themselves are rare event in some countries.

DEPENDENT VARIABLE

- Earlier the distribution of the target variable was positively skewed. We tried to make this distribution somewhat close to normal distribution.
- First we apply log transform but it did not give desired result, or finally applied square root transformation. We got the favorable results, the skewness value was dropped, which is comparatively closer to the normal distribution.

MULTICOLLINEARITY ANALYSIS

MODEL BUILDING PREREQUISITE

Feature Scaling :-

Standardization:

- It is a step of data pre processing which is applied to independent variables or features of data. It basically helps to normalize the data within a particular range. Sometimes, it also helps in speeding up the calculations in an algorithm.
- **Standardization or Z-Score Normalization** is the transformation of features by subtracting from mean and dividing by standard deviation. This is often called as **Z-score**.

$$X_{\text{new}} = (X - \text{mean}) / \text{Std}$$

MODEL BUILDING PREREQUISITE

Normalization:-

- Normalization scales our feature to a predefined range (normally the (0-1) or (-1 to 1) range), independently of the statistical distribution they follow. It does this using **minimum and maximum values** of each feature in the dataset.

$$X' = \frac{X - X_{min}}{X_{max} - X_{min}}$$

MODEL BUILDING PREREQUISITE

- Defining a new function called **tnt_model** which takes model, X_train, y_train, X_test, y_test and print evaluation matrix like MSE, RMSE, R2, Adejusted R2. Also plots the feature importance based on the algorithm used.
- We also defined range of values for hyperparameters such as:
 1. Number of trees: n_estimators =[80,100,150]
 2. Maximum depth of trees: [15,20,30]
 3. Min no of sample required for split a node: [40,60]

LINEAR REGRESSION

- We plotted the graph of actual and predicted dependent variable 'Rented bike count'.
- Since the performance of simple linear model is not so good. We experienced with some complex models.

MSE : 122612.82171875217
RMSE : 350.16113679098106

| 8 | Xtreme_GB | 32714.972085 | 180.872806 | 0.900342 | 0.899701 |

Model Accuracy

Conclusion

- The independent variable in the data does not have a good linear relation with the target variable so the simple linear model was not performing good on this data. Tree based algorithm perform well in this case.
- There is a surge of high demand in the morning 8AM and in evening 6PM as the people might be going to their work at morning 8AM and returning from their work at the evening 6PM.
- After performing the various models the Gradient Boosting and Extreme Gradient Boosting found to be the best model that can be used for the Bike Sharing Demand Prediction since the performance metrics (mse,rmse) shows lower and (r2,adjusted_r2) shows a higher value for the Gradient Boosting and Extreme Gradient Boosting models !
- We can use either Gradient Boosting and Extreme Gradient Boosting model for the bike rental stations.

summary

we believe in giving 110%. By using our next-generation data architecture, we help organizations virtually manage agile workflows. We thrive because of our market knowledge and great team behind our product. As our CEO says, "Efficiencies will come from proactively transforming how we do business."
